

Wiki Cheat Sheet

ITALICS	Example ‘’of italics’’	Example <i>of italics</i>
Bold	Example ‘’of Bold’’	Example of Bold
Unordered list	*First **Nested item **Same as above *Second	° First ° Nested item ° Same as above ° Second
Ordered list	#Item 1 #Item 2 ##Sublist 1 ##Sublist 2 #Item 3	1. Item 1 2. Item 2 1. Sublist 1 2. Sublist 2 3. Item 3
Indent Text	: Single Indentation :: Double ::: Triple	Single Indentation Double Triple
Levels	==Header 2==	Header 2
	===Header 3===	Header 3
	====Header 4====	Header 4
Ruler	-----	Separator line
Strike Out	<strike>NOT</strike>	NOT
Link to another page	[[Page Name]]	
Link to a category	[[Category: CatName]]	
Create a Box of text	Spaces before each line	
Escape Wiki Markup	<nowiki>’hi’</nowiki>	‘hi’

Intermixing HTML with Wiki Markup

Not all HTML is supported, <code>, <div>, ,
, <pre> and are supported. Example:

```
<font color="blue">This is blue</font> this is black.
```

Will appear in the Wiki as:

This is blue this is black

You can create special symbols by using the HTML symbol method, for example © will insert a Copyright symbol. A full list of HTML symbols can be found at: http://www.w3schools.com/tags/ref_symbols.asp

Tables

Tables are quite simple in Wiki Markup.

```
{| Start a table
|- Table Row
| New Cell
! New Header Cell
|} Table end
|+ Table Caption (only between table start and table row, opt.)
```

You can add styling information to a table on the Start table line:

```
{| class="wikitable" style="text-align: center; color: green;"
```

This is CSS type information.

```
{|
| Orange
| Pear
| Plum
|-
| Strawberry
| Cantelope
| Grape
|}
```

Orange	Pear	Plum
Strawberry	Cantelope	Grape

Shorthand you can put multiple cells on one line using a double pipe.

```
{|
| Orange || Pear || Plum
|-
| Strawberry || Cantelope || Grape
|}
```

Links

[<http://www.swcp.com> SWCP] – SWCP with a link to www.swcp.com

[[File: Filename]] – Creates a downloadable file

[[Image: Filename]] – Put a link to an uploaded image.

Options: align (left,right), thumb, width (in pixels) separated by |

Ex. [[Image:Example.jpg|20px|Example Picture]]

Wiki Configuration

The Magic File LocalSettings.php

You'll need to get the file LocalSettings.php, which will be found in the top level of your wiki installation. You can edit it in place if you have shell access or make a copy with FTP and edit it on your local machine. This is where all the wiki settings are found.

1. **Changing your Logo.** Depending on the Wiki theme you've chosen the space for your logo is from 135x135px to 160x160px. I'd recommend using the smaller size in case you want to change themes (skins). Also, it's a good idea to make your Logo have a transparent background so it merges seamlessly with the wiki background. FTP your logo file up to <wiki>/skins/common/images. In the LocalSettings.php file search for Logo. You'll find a line that looks like: `$wgLogo = "$wgStylePath/common/images/wiki.png";` Change the wiki.png to the name of your logo file.
2. **SiteName.** Search for \$wgSitename and you'll find a line like this: `$wgSitename = "Change Me";` This name appears in a number of places on the site, so it's good to change this.
3. **Allow File Uploads.** `$wgEnableUploads = true;`

Modifying the Navigation Bar
